	Urgent	Not Urgent
Important	**Do** • Accept one photo through command-line input • Extract event title, date, time, and location available • Let users review and correct info and fill in missing information. Use the computer's default time-zone and allow changes. • Check all required fields are present before exporting (have error messages for missing/invalid info and allow user to edit or cancel) • Save confirmed information as .ics file for manual import into Google Calendar	**Schedule** • Giving the program several images at once, the user reviews each event in one session • Several reviewed events combined into one calendar file instead of individual exports for each event • Direct integration with Google Calendar • Graphical interface instead of command-line program
Not important	**Delegate** • Using Tess4J (Java wrapper for Tesseract OCR) to extract text from images • Use iCal4j to generate .ics file from the confirmed details • Use java's built in input tools (IO.readln() and Scanner) • Use java's built in java.time classes (ZoneId and ZonedDateTime) for handling local time-zone	**Delete** • Supporting multiple calendar services • Getting timezone automatically from location • Saved preferences (time zone and export location) • Fully fledged calendar-management app • Multi-language integration
